SUMMARY

Software Engineer with 2+ years developing backend services and REST APIs using Java, Spring Boot, and MySQL, alongside client-facing dashboards in React and TypeScript. Skilled in building automated data workflows with Oracle PL/SQL, unit and integration testing using JUnit, Mockito, and Postman, and CI/CD pipelines through Jenkins and Azure DevOps. Proficient in debugging and resolving production incidents.

SKILLS

Methodologies: Agile, Scrum, SDLC

Programming Languages: Java, Python, SQL, JavaScript, TypeScript

Frontend: React, TypeScript, Responsive UI Development, Reusable Components

Backend Development: Java 8/11/17 (Lambda expressions, Stream API), Spring Boot, Spring Security, Hibernate, JPA, RESTful APIs, Microservices architecture, GraphQL

Databases: SQL, MySQL, Mongo DB Integrity, Data Validation

Testing: Unit Testing, API Testing, JUnit, Mockito, Postman

AI-Assisted Development: Generative AI, AI-Assisted Code Review, AI-Assisted Test Case Analysis, AI-Assisted Software Development

DevOps: Git, Jenkins, Azure DevOps, CI/CD, Automated Builds, Release Validation, Deployment Management

Tools & Documentation: Jira, Confluence, Technical Documentation

Soft Skills: Communication, Problem Solving, Critical Thinking, Analytical Thinking, Attention to Detail, Stakeholder Collaboration, Adaptability

EDUCATION

Bachelor of Science in Computer Science | University of Illinois Chicago (UIC)

May 2026

Dean's List: Spring 2024 – Spring 2026

Diploma in Computer Science | SSVPS Polytechnic, India

May 2021

WORK EXPERIENCE

Software Engineer | Northern Trust, Illinois | Chicago, IL

January 2026 - Current

- Collaborated with product managers and business analysts to translate 4 core expense workflows across Employee, Manager, and Finance roles into **REST API** contracts, database schemas, and **RBAC** design requirements.
- Built responsive expense management dashboards using **React** and **TypeScript**, contributing 4 reusable components for submission forms, approval queues, and role-specific status tracking across the approval workflow.
- Contributed 10+ **REST** endpoints in **Java** and **Spring Boot** for expense creation, approval, and status updates, strengthening validation logic and exception handling through AI-assisted code review.
- Integrated **Azure OpenAI** into the expense platform to flag anomalies and summarize submissions for approver review, cutting manual review time by 30% across the approval queue.
- Supported **RBAC** enforcement across Employee, Manager, and Finance tiers within the existing permission framework, reducing unauthorized access attempts by 10% during the approval lifecycle.
- Wrote 15 unit and **API** test cases covering submission, approval, rejection, validation, and access-control scenarios, using AI-assisted analysis to identify functional and authorization edge cases.
- Deployed application changes through **Jenkins** CI/CD pipelines and resolved production defects by analyzing application logs, coordinating with QA across Agile development sprints.

Software Engineer | Practo, India

August 2020 - May 2022

- Engineered **Java/Spring Boot** backend modules with **MySQL** for medicine order-management, integrating pharmacy, laboratory, payment, and notification systems via **REST APIs** with validation and retry logic supporting 10,000+ monthly orders.
- Architected data services in **Java** and **Spring Boot** with **MySQL** to securely ingest and retrieve lab reports, prescriptions, and medical history for a network of 5000+ patients.
- Defined **API** contract and backend design requirements for order-fulfillment processes, including cancellation handling and inventory-synchronization scenarios, by translating operational edge cases from product and operations stakeholders into service-level design decisions.
- Enforced access-control checks on patient-record endpoints to restrict data retrieval to authorized healthcare users, working within the platform's existing authentication and encryption layer rather than owning it outright.
- Implemented input-validation and data-integrity checks across record-handling and order-processing modules to catch incomplete, invalid, and duplicate entries before they reached and disrupted critical downstream production systems.
- Validated **API** behavior through unit and integration tests in **JUnit** and **Mockito** alongside manual checks in **Postman**, and integrated automated builds into **Jenkins** pipelines supporting 10+ production releases.
- Monitored application health and proactively resolved failed orders, inventory-synchronization issues, and **API** errors by correlating **Datadog** metrics with application logs during ongoing root-cause investigations across services.

PROJECTS

AgriMitra – AI-Powered Waste Management Platform: Developed a full-stack web application using **Flask**, **React**, and **OpenAI APIs** to support waste disposal decisions. Integrated weather and location data to provide real-time, eco-friendly recommendations. Implemented **MongoDB** backend services to support chatbot interactions and application data persistence.

2-Player Networked Poker Game: Designed a real-time multiplayer Three Card Poker game using **Java Sockets** with a client-server architecture. Built an interactive interface using **JavaFX** and synchronized gameplay state between connected players. Implemented server-side logic for game flow, dealer actions, and automated win evaluation.

CTA Database Application: Created a command-line Python application integrated with SQL to analyze CTA ridership trends across stations. Designed relational SQL queries across multiple tables to extract station-level and time-based insights. Visualized ridership patterns using Matplotlib to support data-driven analysis and interpretation insights.
